

# Math101C: Integral Calculus

## Integration by partial fraction decomposition

S. Nie<sup>1</sup>

<sup>1</sup>Department of Mathematics  
University of British Columbia

Small Class III for C15,18,22,24

# Outline

- 1 Problems and takeaways
  - Partial fractions - the idea
  - Partial fractions - big example
  - Partial fractions - in context
  
- 2 Additional Problems

# Outline

- 1 Problems and takeaways
  - Partial fractions - the idea
  - Partial fractions - big example
  - Partial fractions - in context
- 2 Additional Problems

# the idea

## Examples

- Which would you rather integrate?

1

$$\int \left( \frac{1}{x-1} - \frac{1}{2x+1} \right) dx$$

2

$$\int \left( \frac{x+2}{2x^2-x-1} \right) dx$$

3 Neither

4 Both

# the idea

## Examples

- Alright, let's solve the integral in 1

1

$$\int \left( \frac{1}{x-1} - \frac{1}{2x+1} \right) dx$$

# the idea

## Examples

- What happens if we find a common denominator and add the fractions in integral 1

# the idea

## Takeaway

Integral 2 would be doable but we need a way to “undo” finding a common denominator. This method is called the method of *partial fractions*.

# Outline

- 1 Problems and takeaways
  - Partial fractions - the idea
  - Partial fractions - big example
  - Partial fractions - in context
- 2 Additional Problems

## big example

## Examples

- Consider  $\int \left( \frac{7x+13}{(2x+5)(x-2)} \right) dx$ . Start by supposing our function can be written in the following way

$$\frac{7x+13}{(2x+5)(x-2)} = \frac{A}{2x+5} + \frac{B}{x-2}$$

- Our goal is to find constants A and B
- How do we solve for A and B

# big example

## Examples

- We can also now compute the integral

$$\int \left( \frac{7x + 13}{(2x + 5)(x - 2)} \right) dx$$

# Takeaways

## Takeaways

- When doing partial fractions, selecting convenient  $x$  values can simplify your algebra.
- Write the big fraction as two simpler fractions and solve for the numerator.

# Outline

- 1 Problems and takeaways
  - Partial fractions - the idea
  - Partial fractions - big example
  - Partial fractions - in context
- 2 Additional Problems

# in context

## Examples

- Compute  $\int \sec x dx$ . Let's transform this in a few steps
  - Step 1: Transform the integral into  $\int \frac{\cos x}{\cos^2 x} dx$ .
  - Step 2: Assuming step 1, apply the substitution  $u = \sin x$  to transform the integral into  $-\int \frac{1}{u^2-1} du$ .

# in context

## Examples

- Now we can compute the integral through method of partial fraction.

$$\int \sec x dx$$

# Takeaways

## Takeaways

- Sometimes we combine partial fractions with other techniques.

# Additional Problems

- CLP-2 Section 1.10: Q7, Q8, Q11, Q12, Q18, Q19, Q24, Q26

# For Additional Problems I

E. Yeager, J. Feldman, A. Rechnitzer
